Team Name : AI Visionaries

Team Leader Name : Prathmesh Gattani

Problem Statement : AI for Learning & Developer Productivity

Brief about the Idea:

AI Project Brain

An AI-powered Persistent Organizational Memory System that continuously learns from project updates and enables intelligent contextual knowledge retrieval, onboarding, and decision tracking.

Problem:

- Knowledge scattered across documents, code, emails
- Repetitive knowledge transfer (KT)
- Onboarding takes weeks
- Dependency on senior developers

Solution:

AI system that:

- Stores knowledge in compact structured form
- Enables contextual Q&A
- Generates onboarding roadmap
- Tracks project evolution over time

How different is it from any of the other existing ideas?

✗ Existing Tools:

- Google Drive → Just storage
- Confluence → Manual documentation
- Chatbots → No project-specific memory

✓ Our Differentiation:

1. Uses RAG (Retrieval Augmented Generation)
2. Builds semantic memory using vector embeddings
3. Context-aware answering
4. AI-powered onboarding mode
5. Timeline intelligence tracking

How It Solves the Problem ?

Before:

- 2–3 weeks onboarding
- Multiple KT meetings
- Knowledge loss when employees leave

After AI Project Brain:

- Onboarding reduced to hours
- Instant contextual answers
- Structured decision history
- Reduced dependency on individuals

USP of the Proposed Solution.

- ❖ Persistent AI Memory
- ❖ Contextual Project Understanding
- ❖ AI Onboarding Assistant
- ❖ Timeline Intelligence
- ❖ Knowledge Graph Visualization
- ❖ Scalable Enterprise Architecture

Features Offered

Core Features

1. Intelligent Knowledge Compression
2. Conversational Project Q&A
3. Smart Onboarding Mode
4. Timeline-Based Change Tracking
5. Knowledge Graph Visualization
6. Role-Based Information Views
7. Risk Insight Mode (Bug-prone area detection)

Use Case Diagram:

Actors:

- Developer
- Project Manager
- Admin

Use Cases:

- Upload project documents
- Query project knowledge
- Generate onboarding roadmap
- View architecture summary
- View change timeline

Technologies to Be Used

Frontend:

- Blazor
- Bootstrap / Angular
- Chart.js / Graph visualization

Backend:

- ASP.NET Core
- REST API

AI Layer:

- Python Flask
- LLM API
- FAISS Vector Database
- RAG Architecture

Deployment:

- AWS EC2
- AWS S3

Future Scope :

- Auto codebase understanding
- Enterprise SaaS model
- Healthcare knowledge system
- Multi-language support (Bharat-focused)
- Voice-enabled onboarding assistant
- Integration with GitHub repositories

Impact :

- ✓ Reduces onboarding time by 70%
- ✓ Increases productivity
- ✓ Prevents knowledge loss
- ✓ Scalable for enterprises
- ✓ Can evolve into SaaS startup
